Skill Demonstrated

Skill: Alter code generated by AI to add a feature

Explanation

I used AI as a coding assistant while building the GPS project. The app was expanded beyond a basic location display by adding a boundary/geofence feature. This feature lets the user set the current GPS location as the center point, enter a radius, and then see whether the current location is inside or outside that boundary.

This satisfies the skill because the original AI-assisted code was changed and expanded to add a working feature instead of only using the starting code. Screenshots should be included below to show the app running and the added boundary feature working.

Proof Screenshot 1: GPS Location Display

Paste a screenshot showing latitude and longitude values in the app.
