App Summary

This Android app uses GPS/location data to display latitude, longitude, accuracy, altitude if available, speed if available, and a simple inside/outside boundary check.

Screenshot 1: App Opened

This screenshot shows the GPS Project app running on the Android emulator.

[Paste screenshot here]

Screenshot 2: Location Permission

This screenshot shows that the app requests location permission so it can read GPS/location data.

[Paste screenshot here]

Screenshot 3: Current GPS Location

This screenshot shows latitude and longitude values after setting an emulator location.

[Paste screenshot here]

Screenshot 4: Live GPS Updates

This screenshot shows the app receiving live location updates.

[Paste screenshot here]

Screenshot 5: Boundary Center Set

This screenshot shows the current location being used as the geofence/boundary center.

[Paste screenshot here]

Screenshot 6: Inside/Outside Boundary Status

This screenshot shows the app checking whether the current location is inside or outside the selected radius.

Conclusion

This app satisfies the GPS project because it uses GPS/location data and demonstrates the results through screenshots from an emulator or device.
